

Amendments to the Specification:

Page 7, the paragraph beginning on line 21 is amended as follows:

--The web 1 being processed now leaves the dryer wire 2 and passes onto a second wire 11 that runs over a guide roll 12 so as to transfer and support the web in the following web treatment device. Over the distance from the postdryer cylinder 9 to the guide roll 12 of the second wire 11, the web 1 travels without support by a wire. However, the web can be passed over such a short distance unsupportedly inasmuch the web is not subjected to any stressing treatment and the web is relatively dry, whereby it is most tolerant to a possible tensional stress due to variations in web draw. This open passage of web travel can be utilized for measuring various qualities of the paper using a measurement beam sensing the sheet from both sides. However, it is also possible to pass the web if so required directly in a supported manner from the dryer wire 2 to the next dryer wire 11 using any conventional supporting means **10**.--
